this textbook provides an introduction to representations of general algebras by unbounded operators on hilbert space a topic that naturally arises in quantum
mechanics but has so far only been properly treated in advanced monographs aimed at researchers the book covers both the general theory of unbounded
representation theory on hilbert space as well as representations of important special classes of algebra such as the weyl algebra and enveloping algebras associated
to unitary representations of lie groups a broad scope of topics are treated in book form for the first time including group graded algebras the transition probability
of states archimedean quadratic modules noncommutative positivstellensätze induced representations well behaved representations and representations on rigged
modules making advanced material accessible to graduate students this book will appeal to students and researchers interested in advanced functional analysis and
mathematical physics and with many exercises it can be used for courses on the representation theory of lie groups and its application to quantum physics a rich
selection of material and bibliographic notes also make it a valuable reference

this book gives an introduction to c algebras and their representations on hilbert spaces we have tried to present only what we believe are the most basic ideas as

simply and concretely as we could so whenever it is convenient and it usually is hilbert spaces become separable and c algebras become gcr this practice probably creates an impression that nothing of value is known about other c algebras of course that is not true but insofar as representations are concerned we can point to the empirical fact that to this day no one has given a concrete parametric description of even the irreducible representations of any c algebra which is not gcr indeed there is metamathematical evidence which strongly suggests that no one ever will see the discussion at the end of section 3 4 occasionally when the idea behind the proof of a general theorem is exposed very clearly in a special case we prove only the special case and relegate generalizations to the exercises in effect we have systematically eschewed the bourbaki tradition we have also tried to take into account the interests of a variety of readers for example the multiplicity theory for normal operators is contained in sections 2 1 and 2 2 it would be desirable but not necessary to include section 1 1 as well whereas someone interested in borel structures could read chapter 3 separately chapter i could be used as a bare bones introduction to c algebras sections 2

this open access book presents the key aspects of statistics in wasserstein spaces i e statistics in the space of probability measures when endowed with the geometry of optimal transportation further to reviewing state of the art aspects it also provides an accessible introduction to the fundamentals of this current topic as well as an overview that will serve as an invitation and catalyst for further research statistics in wasserstein spaces represents an emerging topic in mathematical statistics situated at the interface between functional data analysis where the data are functions thus lying in infinite dimensional hilbert space and non euclidean statistics where the data satisfy nonlinear constraints thus lying on non euclidean manifolds the wasserstein space provides the natural mathematical formalism to describe data collections that are best modeled as random measures on euclidean space e g images and point processes such random measures carry the infinite dimensional traits of functional data but are intrinsically nonlinear due to positivity and integrability restrictions indeed their dominating statistical variation arises through random deformations of an underlying template a theme that is pursued in depth in this monograph

most books on linear operators are not easy to follow for students and researchers without an extensive background in mathematics self contained and using only matrix theory invitation to linear operators from matrices to bounded linear operators on a hilbert space explains in easy to follow steps a variety of interesting recent results on linear operators on a hilbert space the author first states the important properties of a hilbert space then sets out the fundamental properties of bounded linear operators on a hilbert space the final section presents some of the more recent developments in bounded linear operators

this book offers a comprehensive and reader friendly exposition of the theory of linear operators on banach spaces and banach lattices using their topological and order structures and properties abramovich and aliprantis give a unique presentation that includes many new and very recent developments in operator theory and also draws together results which are spread over the vast literature for instance invariant subspaces of positive operators and the daugavet equation are presented in monograph form for the first time the authors keep the discussion self contained and use exercises to achieve this goal the book contains over 600 exercises to help students master the material developed in the text the exercises are of varying degrees of difficulty and play an important and useful role in the exposition they

help to free the proofs of the main results of some technical details but provide students with accurate and complete accounts of how such details ought to be worked out the exercises also contain a considerable amount of additional material that includes many well known results whose proofs are not readily available elsewhere the companion volume problems in operator theory also by abramovich and aliprantis is available from the ams as volume 51 in the graduate studies in mathematics series and it contains complete solutions to all exercises in an invitation to operator theory the solutions demonstrate explicitly technical details in the proofs of many results in operator theory providing the reader with rigorous and complete accounts of such details finally the book offers a considerable amount of additional material and further developments by adding extra material to many exercises the authors have managed to keep the presentation as self contained as possible the best way of learning mathematics is by doing mathematics and the book problems in operator theory will help achieve this goal prerequisites to each book are the standard introductory graduate courses in real analysis general topology measure theory and functional analysis an invitation to operator theory is suitable for graduate or advanced courses in operator theory real analysis integration theory measure theory function theory and functional analysis problems in operator theory is a very useful supplementary text in the above areas both books will be of great interest to researchers and students in mathematics as well as in physics economics finance engineering and other related areas and will make an indispensable reference tool

this book offers a gentle introduction to key elements of geometric algebra along with their applications in physics robotics and molecular geometry major applications covered are the physics of space time including maxwell electromagnetism and the dirac equation robotics including formulations for the forward and inverse kinematics and an overview of the singularity problem for serial robots and molecular geometry with 3d protein structure calculations using nmr data the book is primarily intended for graduate students and advanced undergraduates in related fields but can also benefit professionals in search of a pedagogical presentation of these subjects

digital space offers new avenues opportunities and platforms in the fight for gender equality and for the social economic and political participation of women and marginalised communities however the very same space plays host to gender inequalities and security threats with gendered implications this edited volume ventures into complexities at the intersection of gender security and digital space with a particular focus on the persistent problems of access harassment and disinformation scholars and practitioners in this volume tackle various facets of the issue presenting an array of research experiences and case studies that span the globe this knowledge lends itself to potential policy considerations in tackling inequalities and threats with gendered implications in cyber space towards digital spaces that are safe and equal this book is a must read for students scholars and practitioners seeking to expand their knowledge on the gendered threats in digital space and potential remedies against them

experiments since 1911 prove that the distance between nuclear particles constituting atomic bodies is a hundred thousand times larger than the diameters of these particles hence the volumes of all atomic bodies including ourselves are space like empty a hundred times more empty than the volume of the solar system scores of

experiments also prove that space contains electrons and positrons bound to each other by energies of a million electron volts per pair and form a cubic lattice named the epola based on the epola model of space this book reveals the physical nature of inertia gravitation the spreading of electromagnetic and gravitational actions in space with the velocity of light and derives their laws the postulates of quantum and relativity theories are also derived and turned into explainable physical laws thus physics is restored as the natural science it had been before it was turned into a science of axiomatic statements and calculations the book will appeal both to serious scientists and students as well as the general reader interested in scientific explanations of the physical world since as a natural science physics deals with the simplest and most basic natural phenomena this book will be as accessible to the general public as biology books

in the early modern period as both reformed and catholic churches strove to articulate orthodox belief and conduct through texts sermons rituals and images communities grappled frequently with the connection between sacred space and behavior the sacralization of space and behavior in the early modern world explores individual and community involvement in the approbation reconfiguration and regulation of sacred spaces and the behavior both animal and human within them the individual s understanding of sacred space and consequently the behavior appropriate within it depended on local need group dynamics and the dissemination of normative expectations while these expectations were defined in a growing body of confessionalizing literature locally and internationally traditional clerical authorities found their decisions contested circumvented or elaborated in order to make room for other stakeholders activities and needs to clearly reveal the efforts of early modern groups to negotiate authority and the transformation of behavior with sacred space this collection presents examples that allow the deconstruction of these tensions and the exploration of the resulting campaigns within sacred space based on new archival research the eleven chapters in this collection examine diverse aspects of the campaigns to transform christian behavior within a variety of types of sacred space and through a spectrum of media these essays give voice

to the arguments exhortations and accusations that surrounded the activities taking place in early modern sacred space and reveal much about how people made sense of these transformations
